

Experiment 0: Viva Question.

1. What is OpenCV and why it is used?

OpenCV or Open Source Computer Vision Library is an open-source library widely used for computer vision and machine learning applications. It provides a comprehensive set of tools and algorithms for processing images and videos.

It is used for:

- Image Processing
- Object Detection
- Video Analysis
- Machine Learning
- Real time Computer Vision.

2. How do you install packages using Pip?

You can install packages in Python using pip command in the terminal or command prompt.

`Pip install package-name`

3. What command is used to launch Jupyter Notebook?

`Jupyter notebook`

4. What is the function of `cv2.imread()`?

It is used to read or load an image from a specified file path.

5. How do you display an image using opencv?
In open cv we can display an image using the `cv2.imshow()` function

`cv2.imshow(window-name, image)`

`cv2.waitKey()`

`cv2.destroyAllWindows()`

Ex
